1.3	An example of two side-by-side images	2

List of Tables

1.1	An example of a table	3
1.2	Another example of a table	3

Chapter 1

Introduction

This document is a brief introduction to \LaTeX . It is not to be used as a quick start to creating the final year dissertation. It is not meant to be a comprehensive guide to the use of \LaTeX . For that, you could refer to [?]. A cheat sheet ¹ is also available for quick reference.

1.1 Using images in \LaTeX

Images can be inserted using the `figure` environment as follows:

FIGURE 1.1: An example of an image with a short caption.

The `label` command allows you to assign a label to the figure so that you can reference it like so: Figure 1.1.

¹<https://wch.github.io/latexsheet/latexsheet-a4.pdf>

The caption command allows you to define an optional caption, in the square brackets, which is used in the list of figures. This comes in handy when the figure requires a long caption as follows:

FIGURE 1.2: An example of an image with a long caption which is shortened in the table of contents. This is a long caption to illustrate why you would need to specify the second caption in the square brackets in the caption command.

1.1.1 Side by side images

The `subfigure` package allows you to place figures side-by-side as follows:

FIGURE 1.3: Placing images side-by-side.

If you label the individual image, you could also reference it as an individual: Figure 1.3(a) or as a whole Figure 1.3. You could place a caption with the individual image by placing text in the square brackets after the subfigure, or you could omit them completely and the figure will not be labelled.

Note that usually, figures are placed at the top of the page and to do so, the placement instruction should be `t`. Figures are placed using `h!` only for illustrative purposes.

1.2 Using tables in L^AT_EX

Tables can also be inserted easily into your document. The `booktabs` package is recommended as it allows you to typeset nice-looking tables. Like figures, tables should be captioned, but unlike figures, the caption is usually placed at the top of the page. Tables can be labelled and referenced in the same way as figures. Table 1.1 provides one such example. This table has examples of how L^AT_EX handles merged rows and columns.

TABLE 1.1: An example of a table which has examples of merged columns and merged rows.

Drawing	Method 1		Method 2	
	Some result	Some other result	Some result	Some other result
4.1	100	0	51	49
4.2	100	0	57	43
4.3	100	0	39	61
4.4	90	10	39	61
	80	20	39	61

It is also possible to use tables which require more text in their columns. This can be done by using the `paragraph` column setting as illustrated in Table 1.2.

TABLE 1.2: An example of a table which has a paragraph column.

Some random text	Result
Papalla jolloin me et kelpasi ei hyllyen en. Oma ulos juon ensi toru toi ole kone han.	100
Syotin ei tekisi puista ai tiedat olette olivat he. Herra minka ei en se ai masto.	80

1.3 Using equations in L^AT_EX

L^AT_EX is also very good in handling equations, be it small equations which can fit in text like this: $y = mx + c$ or more complex equations which require to be displayed on separate lines such as this:

$$f(x) = a \exp \left(-\frac{(x-b)^2}{2c^2} \right) \quad (1.1)$$

It is possible to label equations so that you can refer to them in the same way we did for the figures and tables, that is, Equation [1.1](#).

If your equation has two or more parts to it, then you could use the `eqnarray` environment, or better still, the `align` environment as follows:

$$2x - 5y = 8 \quad (1.2)$$

$$3x + 9y = -12 \quad (1.3)$$

If you do not want to have both equations numbered, then you could use the `nonumber` option

$$\begin{aligned} 2x - 5y &= 8 \\ 3x + 9y &= -12 \end{aligned} \quad (1.4)$$

Equations that contain arrays can also be easily included

$$f(x) = \begin{pmatrix} \sin \theta & \cos \theta \\ \cos \theta & \sin \theta \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} \quad (1.5)$$

and if your equations contains cases, these can be written as follows:

$$\chi(m) = \begin{cases} 1, & \text{if } \kappa_j(m) \neq 0 \\ 0, & \text{otherwise} \end{cases} \quad (1.6)$$

1.4 Populating the acronyms and symbols pages

In your document, you may also wish to make use of symbols and acronyms. \LaTeX allows you to define these as you're writing your document and takes care to collect these under the appropriate lists in the front matter. The two examples below are meant to give you an idea of how to use the `glossaries` package. For a more detailed description, refer to [?].

1.4.1 The list of Symbols

Symbols can be defined by giving the symbol a name, telling \LaTeX what it should look like, and giving it a definition as follows:

```
\newglossaryentry{emptyset}
{
  name={\ensuremath{\emptyset}},
  description={the empty set}
}
\gls{emptyset}
```

The symbol can then be referenced in text using `\gls{emptyset}`. For example, we could say : An empty set, denoted by \emptyset , is a set which contains nothing.

1.4.2 The list of Acronyms

It is also possible to define acronyms using

```
\newacronym{EEG}{EEG}{electroencephalogram}
```

Here the `glossaries` package will take care of making sure that the first time this is used, the acronym will be spelt out in full, while all other times you will get just the abbreviations. For example: Electric charge from the scalp can be measured using an [electroencephalogram \(EEG\)](#). The [EEG](#) does not hurt but makes you look funny.

Depending on the nature of your acronyms, you may decide to go all fancy for example:

[non-photorealistic animation rendering \(NPAR\)](#) is a cool research area. Through [NPAR](#) you can create different renderings of your photos.

1.5 Creating Lists

L^AT_EX also provides a very neat way of including lists in your documents. There are three types of lists that can be used as detailed hereunder. Note that all lists can have nested lists within each item if this is necessary.

1.5.1 Bullet lists

These are created using the `itemize` environment:

- Item 1
- Item 2
- Item 3

1.5.2 Numbered lists

These are created using the `enumerate` environment:

1. Numbered item 1
2. Numbered item 2
3. Numbered item 3

1.5.3 Descriptive list

This is a list created using the `description` environment and comes handy when you have a list of items to describe:

Domestic cat: a small, usually furry, domesticated, and carnivorous mammal. It usually has four legs, two ears and a tail.

Tiger: a slightly bigger and more aggressive version of the domestic cat. Keeping one at home can be considered crazy.

1.6 Definitions, Lemmas and Proofs

Sometimes, it may be necessary to give mathematical theory and this can be achieved through the use of Lemmas and Definitions as follows:

Algorithm 1 Accumulate the co-occurrence matrix $S_{\mathbf{d}}(\theta, \Delta\theta)$, locating the junction position \mathbf{x} and edge segment orientations $\{\theta_n\}_{n=1}^N$

Input: Image I , centre of family of circles \mathbf{c} , size of family of circles M

Output: Co-occurrence matrix $S_{\mathbf{d}}(\theta, \Delta\theta)$

for all \mathbf{d} **do**
 for all $(\theta, \Delta\theta)$ pairs **do**
 for all r in the family of circles **do**

$$\mathbf{k}_\beta = [\cos(\beta), \sin(\beta)]^T$$

$$I_r(\beta) = \mathbf{c} + r\mathbf{k}_\beta$$

$$\beta(\theta) = \theta \pm \sin^{-1}(d/r \sin(\alpha - \theta))$$

$$S_{\mathbf{d}}(\theta, \Delta\theta) \leftarrow S_{\mathbf{d}}(\theta, \Delta\theta) + 1/M I_r(\beta(\theta)) I_r(\beta(\theta + \Delta\theta))$$

end for
 end for
end for

$$(\hat{\mathbf{d}}, \hat{\theta}, \Delta\hat{\theta}) \leftarrow \max\{S_{\mathbf{d}}(\theta, \Delta\theta) > T\}$$

$$\mathbf{x} \leftarrow \mathbf{c} + \hat{\mathbf{d}}$$

$$\{\theta_n\}_{n=1}^N \leftarrow \bigcup \left\{ \hat{\theta}, \hat{\theta} + \Delta\hat{\theta} \right\}$$

Definition 1. Let $\|a''\| \ni 0$ be arbitrary. We say a function $l_{\Xi, Y}$ is **Poncelet–Kummer** if it is co-measurable.

Lemma 1. Let $\hat{m} \geq \Phi_{r, \omega}$ be arbitrary. Let $\chi \in \emptyset$ be arbitrary. Then every bounded equation is connected, multiply extrinsic and Riemannian.

You may also wish to include proofs. Sometimes, if these are long and nasty, they might be better off in the Appendix. For example, Appendix A illustrates the use of the proof environment.

1.7 Algorithms

You may also find it necessary to use pseudocode to describe some algorithm. This can be handled using the `algorithm` environment which gets to have a placement indicator and a caption like the figures and tables. Algorithm 1 gives an example of how this could be used.

Chapter 2

Conclusion

Led ask possible mistress relation elegance eat likewise debating. By message or am nothing amongst chiefly address. The its enable direct men depend highly. Ham windows sixteen who inquiry fortune demands. Is be upon sang fond must shew. Really boy law county she unable her sister. Feet you off its like like six. Among sex are leave law built now. Appendix A

Some Random Stuff

Proof. By an easy exercise, F is larger than M . Because

$$\begin{aligned} E'(0, -1) &\supset \sum_{\hat{v} \in \Sigma} \int \theta \left(1^9, \frac{1}{-\infty} \right) dH' \cup \cdots \vee a \left(\sqrt{2}\sqrt{2}, \dots, T^{-7} \right) \\ &\leq \varprojlim \int_{-1}^{\emptyset} -\bar{\eta} d\mathbf{M}_y \times \cdots \vee T \left(\Lambda'', \mathbf{D}^2 \right), \end{aligned}$$

$$\begin{aligned} \sin^{-1} \left(Z''^8 \right) &\leq \frac{\mathbf{e} \left(\emptyset, \mathcal{N} \right)}{\pi \left(\pi^2, -1 \right)} + \cdots \wedge \sin^{-1} \left(\|C''\| \right) \\ &> \varprojlim \bar{2} \\ &< \bigotimes \overline{\|\hat{\mathbf{q}}\| \pi} \\ &> \oint_{E_{\Psi}} i^{-6} dV + \|Y''\| \times e. \end{aligned}$$

In contrast, if Q is unconditionally right-compact then $\mathbf{b}' \in \bar{q}$. Of course, if Z' is not less than G then I is comparable to \mathfrak{v} .

Let $\mathcal{U} \geq \rho$ be arbitrary. It is easy to see that $\hat{\mathbf{r}}$ is semi-simply left-stable and essentially convex. By degeneracy, if $y \leq \mathbf{Q}$ then $\delta_{w,\sigma}(\bar{\mathbf{u}}) = 2$. One can easily see that \tilde{O} is simply unique. On the other hand, $\mathbf{V} < \infty$. Hence if μ_F is isomorphic to \mathcal{J} then every algebraically covariant domain is ultra-algebraic. By a well-known result of Lie, if $\bar{\mathbf{I}}$ is not homeomorphic to ω then there exists an unconditionally

differentiable, nonnegative and universal isomorphism. It is easy to see that

$$\begin{aligned}
 2\mathcal{R} &= \left\{ \mathbf{s}_{M,M}(\hat{\varphi})^{-6} : h_O^8 \subset \prod_{\omega(Z)=-\infty}^{\aleph_0} y(\mathcal{X}, \dots, \mathbf{m}_\gamma) \right\} \\
 &= \left\{ 1^{-7} : A^{-6} = \int \limsup \hat{D}(1, r0) \, df \right\} \\
 &\cong \int \bigcup \overline{\beta^1} \, d\mathbf{r} \wedge v(C \cup |Z|, \phi) \\
 &\neq \frac{\overline{\aleph_0^{-4}}}{\sinh(\vartheta)} \cdot 1^{-7}.
 \end{aligned}$$

Moreover, if the Riemann hypothesis holds then

$$-e = \left\{ \infty : \tanh^{-1}(j') \leq \iiint_{\iota} \bar{C}(0, \dots, \Phi \cap 1) \, dP^{(\mathfrak{g})} \right\}.$$

Let $\hat{e} = -1$. Clearly, every free manifold acting naturally on a complex subalgebra is integral, connected and Selberg. Therefore every hyper-essentially Euclidean, Gaussian, conditionally ultra-intrinsic function is partially Germain. Moreover, if $\|\mathbf{O}''\| = -1$ then Hausdorff's conjecture is false in the context of right-independent domains. Next, if Galois's criterion applies then $x_{e,r}(\mathbf{f}') \leq |\hat{q}|$. Since there exists a quasi-bijective, conditionally quasi-continuous and contra-Möbius geometric subset, $\mu \geq \tilde{\mathbf{k}}$. It is easy to see that \hat{U} is homeomorphic to \mathbf{N} . Thus if $\tilde{\kappa}$ is smaller than \mathfrak{z} then the Riemann hypothesis holds. Note that if $\|\mathbf{Y}\| > e$ then the Riemann hypothesis holds.

Clearly, if ϕ is pseudo-Legendre then

$$-\mathbf{G} \subset A\left(\sqrt{2}^9, \dots, \frac{1}{\mathfrak{p}}\right) + \overline{\sqrt{2}}.$$

On the other hand, if $v \in \aleph_0$ then $\bar{\omega} \geq \emptyset$.

Let $\mathbf{p}^{(\mathcal{J})}$ be a plane. We observe that if A' is linearly intrinsic then Siegel's criterion applies. Now if l is Torricelli, maximal, everywhere Cantor and stochastically contra-associative then $k_{\mathcal{P},\mathfrak{x}}$ is dominated by Q . On the other hand, if Fréchet's criterion applies then Wiener's condition is satisfied. Hence every integrable matrix is algebraically Riemannian. \square
